                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the complete amino acid sequence of the human endothelial cell growth factor (ECGF). The protein is further processed alpha-ECGF (starting from Ala at position 2; W75414) and alpha-ECGF (starting from the Asn at position 22; W75413). When the beta-ECGF is cleaved with trypsin, the resulting N-terminal sequence is similar to the N-terminal sequence of acidic fibroblast growth factor (a FGF). The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bowine ECGF (see W75416). The ECGF protein can be used in compositions for promoting wound healing. ECGF is also used to grow cells on a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 replacement of the Cys residues to reduce aggregation. The mutein is obtained by site-specific or site-directed mutagenesis of FGF-1 DNA, incorporation of the mutated DNA into a vector and expression in host cells. The FGF muteins are used to treat heparin-related disorders, such as excessive bleeding induced by heparin, ophthalmic disorders and heparin-associated thrombocytopenia and thrombosis. They may also be used for drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13 TEKFNLP-PG--NYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDOHIOLOLSAESVGEV

Example: Ftg 8: 43pp; English.

To screen the human brain stem cDNA library for clones contg. ECGF inserts, a specific oligonucleotide was designed. This oligonucleotide was based upon a partial AA sequence analysis of the amino terminus of ECGF (see F70480 and F70481). Fig 3s sets bovine alpha and beta ECGF (P70834). The two clones that were isolated, ECGF clones 1 and 29, were analysed in further detail. The nucleotide sequence of these clones and the AA sequence deduced from the nucleot acid sequence is shown in Fig 8 (see N70788 and P70482). Sequence 155 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13 TEKFNLP-PG--NYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEV

Human endothelial cell growth factor (ECGF) protein sequence. Endothelial cell growth factor; ECGF; cleavable; recombinant; repair; regenerate; blood vessel; endothelial cell; human.
                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 108-109; 128pp; English.

Novel fusion proteins comprise FGF linked to saporin. FGF-1 to -9
may be used, pref. FGF-1 (R70812), FGF-5 (R70813). FGF-7 (R70814) or
FGF-8 (R70815) muteins, in which at least 1 Cys residue is replaced
by conservative Ser substitutions. The fusion proteins are potent
cytocidal agents to cells bearing the FGF receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

New monogenous preparations of cytotoxic conjugates and DNA -
contain fibroblast growth factors and cytotoxic agents for
treating FGF conditions such as tumours, diabetes and rheumatoid
arthritis.

factors (ECCE) and plasmids comprising the DNA sequences. The DNA encodes a cleavable signal peptide and an ECCE, where removal of the signal peptide ylelds a mature form of the ECGF, where the ECGF is alpha-ECGF or beta-ECGF. The DNA is used to produce recombinant ECGF proteins, which can be used in treatments to repair or regenerate blood vessels or other structures lined with endothelial cells. The present sequence represents a human ECGF protein (the encoding cDNA determined from lambda ECGF clones 1 and 29).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       74 YIKSTETGQYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKN 133
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        70 XIKSTETGQYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHARKWFVGLKKN 129

Disclosure, Fig 3a: 18pp; English.

The synthetic bECGF gene incorporates useful restriction sites at frequent intervals to facilitate the cassette mutagenesis of selected regions. Also included are flanking sites to simplify the incorporation of the gene into any expression system. becGF is one of the factors involved in the regulation of homeostasis of blood vessels acting in part through effects on endothelial cells. Such factors may also play a role in stages of atheroscierosis and tumour growth and development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                .;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ţ

Example D; Fig 8; 22pp; English.

Human endothelial cell growth factor (EGGF) is a mitogen for endothelial cells. Its amino acid sequence was deduced from a cDNA clone (T45985) isolated from a human brain stem library. Recombinant EGGF-beta (W06815) and EGGF-alpha (W06817) can be produced in transformed host cells. They have utility in the growth and amplification of endothelial cells in culture, and optentially be used to treat damaged blood vessels and other endothelial cell-lined structures. They also have diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 168;

Compositions for promoting wound healing - containing endothelial cell growth factor polypeptides

Claim 1; Column 16; 23pp; English.

This sequence represents the amino acid sequence of the mature human alpha endothelial cell growth factor (a-ECGF). The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bovine ECGF (see W75416-W75418). The ECGF protein can be used in compositions for promoting wound healing. ECGF is also used to grow cells on a prosthetic device.

-!- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOGENIC AGENTS
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-FEB-1991 (Rel. 17, Created)

-!- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOGENIC AGENTY
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                             Rattus norvegicus (Rat).
